

**Pennsylvanians Against Fracking is working with our partners in the agricultural community to collect signatures for a letter to Governor Tom Wolf calling on him to stop fracking and lead the transition to sustainable energy. Highlights of the letter are below. We hope you'll sign on, but if you prefer to read the full letter, please visit <http://bit.ly/agletter>.**

Dear Governor Wolf,

We, the concerned farmers of Pennsylvania, begin this letter with both hope and fear. Our hopes are that you will read the following with careful consideration and that our heartfelt sentiments will reach you. Our fears are for our way of life, which many of us find to be balancing precariously in the face of destructive activities like hydraulic fracturing and the looming threat of climate change. It is hard not to feel like the odds are stacked against us -with the scale of gas development and its swiftness in encompassing our communities. Faced with big industries with deep pockets as unwelcome neighbors, moving in whether you have leased your land or not there seems to be little we can do. With that in mind we are turning to our government, again with the hope that our voices do matter, that our concerns will be taken seriously and our Governor will prove himself to be for the people.

- Air Quality – studies have found 44 hazardous chemicals in the air, many of which cause cancer and damage to the brain, nervous system lungs, kidneys, cardiovascular system, endocrine system, genes, liver, immune system, skin, eyes and other parts of the body.
- Water Quality - For a farmer, clean water is the basic necessity. However, with the fracking we have seen known carcinogens injected through our aquifers or sitting in frack ponds. Known endocrine disruptors make up around 40% of the chemicals added to fracking fluids. Leaks, spills, and unintended releases are abundant.
- Business Concerns - Farmers who are certified organic face the loss of their market and their certifications when toxic industries move in next door.
- Climate Change - Hydraulic fracturing is causing problems to farmers every day, but as a major contributor to climate change the natural gas industry is leading us even further into a climate crisis where the farmer will be the first to feel the effects.
- Health impacts, present now and yet to come - Farmers living near well sites (as well as many others in rural gas fields that have sprung up around their homes) are suffering right now from health impacts almost too numerous to mention.

Governor Wolf - we, the farmers of Pennsylvania, are asking you to show your good judgment and commitment to the well-being of Pennsylvanian citizens and look at the facts. Stop the drilling! Bring in jobs for clean energy solutions, stop the cycle of fossil fuel consumption.

Sincerely,
